

Emergency Chipped Tooth

Happy Dentists

If possible find the chipped tooth section

As the dentist can reattach this fragment. If unable to find - the dentist can make a new fragment.

Submerge the tooth fragment in dairy milk

Saliva, saline or plastic wrap can be used but time for cell survival is shorter.

Rinse the child's tooth & face with warm salty water

Check there are no tooth fragments lodged in their lips, gums or tongue

If the chipped tooth is bleeding

Apply a wet gauze to the tooth for several minutes to allow the pressure to stop the bleeding.

Place a Cold compress

To help with swelling, after the trauma. Water icy poles can work well

See the dentist as soon as possible

Timing is very important in these situations, the sooner the patient is seen the better
